heat distribution and dissipation due to conduction, convection, or radiation for industrial and scientific applications. Ultraflex can provide thermal 2D and 3D simulations and heat transfer analysis for induction heating applications in steady state or transient conditions. Using electromagnetic modeling, the generation of heat due to electromagnetically induced eddy currents in the load can be precisely simulated.

The thermal and electromagnetic problems are solved independently and a supervisor manages these solvings and the data transfers (temperatures and losses). A first 2D example gives qualitative satisfying results and shows the importance of the thermal electromagnetic coupling. There is a need for benchmarks to validate and compare codes.

In order to optimize the design of an enclosed induction machine of railway traction, a multi-physical model is developed taking into account electromagnetic, mechanical and thermal-flow phenomena. The electromagnetic model is based on analytical formulations and allows calculating the losses. The thermal-flow modeling is based on an equivalent thermal circuit which has the feature to consider the flow structure inside the machine.
