The key difference is that the default text processing behaviour in Python 3 aims to detect text encoding problems as early as possible - either when reading improperly encoded text (indicated by `UnicodeDecodeError`) or when being asked to write out a text sequence that cannot be correctly represented in the target encoding (indicated by `UnicodeEncodeError`).

Python - Text Processing. Python Programming can be used to process text data for the requirements in various textual data analysis. A very important area of application of such text processing ability of python is for NLP (Natural Language Processing). NLP is used in search engines, newspaper feed analysis and more recently for voice -based applications like Siri and Alexa.

```
Example: Rotating Text message = "this text  
is spinning" def setup(): global f, theta  
size(200, 200) f =  
createFont("Arial",20,True) theta = 0 def  
draw(): global message, f, theta  
background(255) fill(0) textFont(f) # Set the  
font translate(width/2,height/2) # Translate  
to the center rotate(theta) # Rotate by theta  
textAlign(CENTER) text(message,0,0) theta +=  
0.05 # Increase rotation
```

Strings and Drawing Text - Python Mode for Processing

Read Book Python 3 Text Processing With Nltk 3 Cookbook

Text that does not fit completely within the rectangle specified will not be drawn to the screen. Note that Processing now lets you call `text()` without first specifying a `PFont` with `textFont()`. In that case, a generic sans-serif font will be used instead. (See the third example above.) Related: `textAlign()` `textFont()` `textMode()` `textSize` ...

`text()` \ Language (API) - Python Mode for Processing

`text ()` Draws text to the screen. Displays the information specified in the first parameter on the screen in the position

is one of a software developer's most common tasks. When a user provides input, it needs to be parsed, translated, broken into its component parts, sanitized, and manipulated in countless ways. Python has a broad, high-level toolkit in its standard library that can help you handle all of these tasks and more.

Python Text Processing Modules - Computer Hope

Data Processing with Python Python is the ideal language to process data. It supports JSON and XML out of the box, but there are

also many libraries to aid you with processing data. In this chapter we'll dive into processing data of all kinds.

Data Processing with Python | Python 3 Guide

Once you have the package installed, implementing it with Python3 takes the following form:

```
import preprocessing.text as ptext
from preprocessing.text import keyword_tokenize, remove_unbound_punct,
remove_urls
text_string = "important string at: http://example.com"
clean_string = ptext.preprocess_text(text_string, [remove_urls, remove_unbound_punct,
```
