An effective way of dealing with many two dimensional problems is to introduce a new "unknown", the Airy stress function, an idea brought to us by George Airy in 1862. The stresses are written in terms of this new function and a new differential equation is obtained, one which can be solved more easily than Navier's equations.

constant K and the θ expression for ϕ . Solution: Replacing our proposed stress function into this equation we get: $K \frac{\partial^2 \phi}{\partial x^2} + 2 \frac{\partial \phi}{\partial x} = 2G$
 $K = G \frac{\partial^2 \phi}{\partial x^2} + 2 \frac{\partial \phi}{\partial x}$; and $\theta = G \frac{\partial^2 \phi}{\partial x^2} + 2 \frac{\partial \phi}{\partial x} \times \frac{1}{a^2} + \frac{x^2}{2} \frac{\partial^2 \phi}{\partial x^2}$

The case of a distributed linear load (P') on an infinite solid can be solved with Airy stress functions in polar coordinates. The stress function in this case is $\phi = -\frac{P'}{\pi} r^2 \cos \theta$. The function can be inserted in the biharmonic equation to verify that it is indeed a solution. The stress components obtained from differentiating the stress function are therefore a valid solution to a particular problem. But which one?

Airy Stress Functions - Fracture Mechanics

Stress is the expression of force applied to a unit area of surface. It is measured in psi (English unit) or in MPa (SI unit). Another unit of stress which is not commonly used is the dynes (cgs unit). Stress is the ratio of force over area. $\text{stress} = \text{force} / \text{area}$. Simple Stresses

The solution to the elastostatic problem now consists of finding the three stress functions which give a stress tensor which obeys the Beltrami-Michell compatibility equations for stress. Substituting the expressions for the stress into the Beltrami-Michell equations yields the expression of the elastostatic problem in terms of the stress functions: [3]

Show that the stress function $\phi = \frac{1}{2} \log r + \frac{1}{6} \cos^6 \theta - \frac{1}{6} \sin^6 \theta$ gives the solution to the problem of an elastic half space loaded by a uniformly distributed shear over the free surface ($x_2 < 0$), as shown in the figure. x y

In the absence of body forces, a function that satisfies the compatibility equation of 11.21 is given by the following relation between the Cauchy stresses and the Airy stress function: (11.22) $\sigma_{rr} = \frac{1}{r} \frac{\partial \phi}{\partial r} + \frac{1}{r^2} \frac{\partial^2 \phi}{\partial \theta^2}$, $\sigma_{\theta\theta} = \frac{\partial^2 \phi}{\partial r^2}$, $\tau_{r\theta} = -\frac{\partial}{\partial r} \left[\frac{1}{r} \frac{\partial \phi}{\partial \theta} \right]$

Stress Function - an overview | ScienceDirect Topics

Substituting the above expressions for the stress components into equation (b), we find that the stress function ϕ must satisfy the equation. Thus the solution of a two-dimensional problem, when the weight of the body is the only body force, reduces to finding a solution of above equation, which satisfies the boundary conditions of the problem.

LECTURE NOTES ON

The solution of problems in elasticity presents difficulties, but the procedure may be simplified by the introduction of a stress function. For a particular two-dimensional case, the stresses are related to a single function of x and y such that substitution for the stresses in terms of this function automatically satisfies the equations of

Westergaard found an Airy stress function of complex numbers that is the solution for the stress field in an infinite plate containing a crack. But before getting to the function, a little more notation is needed. Fortunately, it is simple: The integral of $\phi(Z)$ is represented by a function $\Phi(Z)$. Finally, the derivative of $\phi(Z)$ is represented by $\phi'(Z)$.

This is not a direct solution to a posed problem, per se, but is known as... The Inverse Method In general, for cases of plane stress without body force or temp ($\nabla^4 \psi = 0$): 1. A stress function $\psi(x, y)$ is assumed that satisfies the biharmonic equation 2. The stresses are determined from the stress function as defined in equations (8-1) - (8-3) 3.
